

ECON333
Econometric Methods

Semester 1, 2009

Department of Economics

**MACQUARIE UNIVERSITY
FACULTY OF BUSINESS & ECONOMICS
UNIT OUTLINE**

Year and Semester:	Semester 1, 2009
Unit convenor:	Daehoon NAHM
Prerequisites:	ECON232 or ECON233

Students in this unit should read this unit outline carefully at the start of semester. It contains important information about the unit. If anything in it is unclear, please consult one of the teaching staff in the unit.

ABOUT THIS UNIT

The objective of this unit is to provide students, who have developed interest in the subject of econometrics from the second-year econometrics or statistics units, with a valuable opportunity to attain more advanced econometric techniques that are readily applicable to an empirical analysis of economic, financial, or business phenomena. The unit will be suitable to both students who just want to equip themselves with more practical knowledge of econometrics before graduating and those planning to pursue a research degree, such as Honours, MPhil, or PhD.

The topics of the unit are grouped into three parts: discrete-choice models; GLS, stochastic regressors and consistent estimation; and time-series econometrics. For each topic, after an introduction to the underlying theory, interesting examples of practical applications of the model will be provided. To give students hands-on experience for each topic, many tutorial and assignment questions will require the use of econometric software programs such as *Shazam* and *EViews*. The unit carries 3 UG credit points.

TEACHING STAFF

Dr Daehoon Nahm

Office: E4A 525
Tel: 9850 9615
Email: dnaahm@efs.mq.edu.au

Consultation Hours: 1-3 pm Monday or by appointment

CLASSES

Lectures/Tutorials: Tuesday 3:00 pm – 6:00 pm (E6A 108)

Formally, there are thirteen 2-hour lectures and six tutorials. The first two hours are usually used for lectures while the third hour is for tutorials. However, lectures may extend beyond the two-hour period or tutorial questions may be discussed during the lecture hours when necessity arises. Furthermore, in more than six weeks the session will last for more than two hours. Students are strongly recommended to attend all the classes.

The timetable for classes can be found on the University web site at:
<http://www.timetables.mq.edu.au/>

REFERENCES

Greene, William H., (2007), *Econometric Analysis*, 6th edition
Enders, Walter, (2004), *Applied Econometric Time Series*, 2nd edition

For all topics, supplementary notes will be provided (at the unit homepage). Students are expected to download the notes for the next lecture topic and bring them to the lecture.

UNIT WEB PAGE

Useful information and some course material will be made available at the unit homepage: learn.mq.edu.au. Visit the homepage regularly for new information and course material.

LEARNING OBJECTIVE AND OUTCOMES

The learning objective of this unit is to equip yourself with understanding and practical knowledge of important econometric techniques so that you can read and understand research articles and carry out econometric analyses using those techniques.

The learning outcomes of this unit are:

- To clearly understand key concepts and results for each topic covered in the unit.
- To understand the relevance of alternative econometric methods to the analysis of a certain phenomenon of interest.
- To appreciate the advantages and limitations of an econometric method in various situations.
- To be able to specify an econometric model that is appropriate for the problem at hand, estimate it using a relevant method, and interpret the estimation results (including hypothesis testings).
- To be able to report the findings of an econometric analysis.
- To understand matrix algebra.

TEACHING AND LEARNING STRATEGY

Lecture notes, that will be gradually made available before the corresponding lectures throughout the semester, will include key concepts and points that are to be explained and discussed in the lecture. It is essential to get a good grasp of the contents of the lecture notes.

Useful examples are provided in tutorials. Going through the tutorial questions will help better understand the topics discussed in lectures. Solutions to the tutorial questions will be provided at the unit homepage.

Attendance to the lectures/tutorials is not compulsory. However, you may be seriously disadvantaged by missing a lecture/tutorial. If you missed a class for an unavoidable reason, it would be a good idea to borrow notes from a friend and see what were discussed in your absence.

The references listed above may be consulted for more detailed explanations and examples. For some topics, journal articles will be prescribed for further reading.

ASSESSMENT

Final grade of this unit will be based on two within-semester assessments and an end-of-semester examination:

- Within semester test (15%):
Topic: matrix algebra and binary choice models
Date and time: during lecture time on **17 March** (Week 4)
There will be no supplementary test even if you miss this test. If you cannot sit the test due to illness or unavoidable disruption, you will have to apply for special consideration with supporting documentations attached. If approved, this component will not be counted in computing your final grade.
- Assignment (25%) – The questions will be made available on or before 28 April (Week 8) and the due date is **19 May** (Week 11). Late submissions will be penalised by deducting 20 marks for each day after the due date. Always keep a photocopy of document that you submit for assessment, including assignment, to insure yourself against loss.
- Final examination (60%)

The University Examination period in First Half Year 2009 is from 10 June to 26 June. You are expected to present yourself for examination at the time and place designated in the University Examination Timetable. The timetable will be available in Draft form approximately eight weeks before the commencement of the examinations and in Final form approximately four weeks before the commencement of the examinations:
<http://www.timetables.mq.edu.au/exam>.

The only exception to not sitting an examination at the designated time is because of documented illness or unavoidable disruption. In these circumstances you may wish to consider applying for Special Consideration. Information about unavoidable disruption

and the special consideration process is available at <http://www.reg.mq.edu.au/Forms/APSCon.pdf>

If a Supplementary Examination is granted as a result of the Special Consideration process the examination will be scheduled after the conclusion of the official examination period.

You are advised that it is Macquarie University policy not to set early examinations for individuals or groups of students. All students are expected to ensure that they are available until the end of the teaching semester, that is the final day of the official examination period.

To pass the course students must complete the following requirements:

- (1) an overall satisfactory performance in all assessments; and**
- (2) a pass in the final examination.**

PLAGIARISM

The University defines plagiarism in its rules: "Plagiarism involves using the work of another person and presenting it as one's own." Plagiarism is a serious breach of the University's rules and carries significant penalties. You must read the University's practices and procedures on plagiarism. These can be found in the *Handbook of Undergraduate Studies* or on the web at: <http://www.student.mq.edu.au/plagiarism/>

The policies and procedures explain what plagiarism is, how to avoid it, the procedures that will be taken in cases of suspected plagiarism, and the penalties if you are found guilty. Penalties may include a deduction of marks, failure in the unit, and/or referral to the University Discipline Committee.

STUDENT SUPPORT SERVICES

Macquarie University provides a range of Academic Student Support Services. Details of these services can be accessed at <http://www.student.mq.edu.au>.

TOPICS

Part 1:

- Models with Discrete Dependent Variable (Greene Chs. 23 and 16)
 - Binary-choice models
 - Ordered-choice models
 - Multinomial-choice models
 - Maximum likelihood (ML) estimation
- Matrix Algebra (Greene Appendix A)

A supplementary note will be distributed in Week 1.
- Models for Panel Data (Greene Ch. 9)^{*}
 - Fixed-effects model
 - Random-effects model

Part 2: (Greene Chs 4,8.3,12,15)

- GLS
- Stochastic regressors
- Instrumental variables estimation
- Method of moments estimation
- Generalised method of moments

Part 3:

- Time Series Models (Enders Chs 5 & 6, Greene Ch. 22)
 - Nonstationarity and unit root test
 - Cointegration (single-equation approach)
 - Cointegration (multi-equation approach)

*: This topic may be skipped depending upon the availability of time.
